Lost and Found

1. Project Overview

Objective:

The lost and found web system is designed to help the user report, search, and recover their lost belongings in an organized and efficient manner. It replaces manual and unstructured methods like notice boards, social media posts, and messaging groups with a centralized digital platform.

The platform should:

1. Allow users to report lost items.
2. Allow users to report found items.
3. Help match lost items with found items.
4. Enable communication between users.
5. Maintain a searchable database.
6. Protect user privacy.

2. System Users

The platform supports three main user roles:

- **Students:** Report and search for lost/found items.
- **Staff:** Assist in reporting and recovery process.
- **Admin:** Manage users, posts, and overall system moderation.

3. Technology Stack

- **Frontend:** HTML, CSS, JavaScript
- **Backend:** PHP

- **Database:** MySQL
- **Server Environment:** Apache / XAMPP

4. Project Phases

Phase 1: Requirement Analysis

- Identifying user needs (students, staff, admin)
 1. Students (report and search items)
 2. Staff (report and assist in recovery)
 3. Admin (system management)
- System features
 1. Report lost items
 2. Report found items
 3. Search and filter items
 4. Claim and verification system
 5. Admin control panel
- Functional and non-functional requirements
 1. Functional requirements (login, item posting, search, claims)
 2. Non-functional requirements (security, usability, performance)

Phase 2: System Design

- Database structure through ERD diagram

- System architecture

1. **User Layer:** Students and staff register/login, report lost or found items, and submit claims.
2. **Frontend Layer:** Web or mobile interface for reporting, searching, browsing, and claiming items.
3. **Application Server:** Handles authentication, item management, claim processing, and status updates.
4. **Database Layer:** Stores user accounts, lost items, found items, and claim records with approval status.

Phase 3: Frontend Development

Building the user interface.

- Develop frontend using HTML, CSS, JavaScript
- Ensure responsive design for desktop and mobile users

Implement Pages:

- **Login/Register Page**
Allows users to create an account and log in securely.
- **Home Page**
Displays recently posted lost and found items.
- **Post Lost Item Page**
Allows users to submit details of lost items including title, description, category, location, date, and image.
- **Post Found Item Page**
Allows users to report found items with relevant details.
- **Search Page**
Allows users to search and filter items based on keywords, category, or location.
- **User Dashboard**
Shows user's posted items, claims, and status updates.
- **Admin Dashboard**
Allows monitoring of all reports and managing users/items.

Phase 4: Backend Development

The server-side logic will be implemented by the developer.

- Develop backend using PHP
- Create APIs for:
 - User authentication (login/register)
 - Lost item management
 - Found item management
 - Search functionality
 - Claim system
- Implement business logic:
 - Matching lost and found items
 - Handling claim approval/rejection
- Secure backend using:
 - Password encryption
 - Session or JWT authentication
 - Input validation

Phase 5: Database Integration

The database will be connected to the backend.

- Create database using MySQL
- Store and manage:
 - User data
 - Lost items
 - Found items
 - Claims
- Optimize queries for efficient searching and filtering

Phase 6: Testing

Will test all system modules.

- Test authentication system
- Test item posting functionality
- Test search and filter features
- Test claim system
- Fix bugs and improve performance

Phase 7: Deployment

The system will be deployed.

- Deploy frontend and backend on hosting platform
- Connect database to live server
- Perform final testing

Expected Outcome:

The system will provide a centralized platform for reporting and recovering lost items, improving efficiency and reducing manual effort. It will help users quickly find their belongings and manage lost/found reports in a structured way.
